

## CleverScan - depth limiter

<https://ehle-hd.com/en/product/cleverscan-depth-limiter/>

The **manual depth limiter** enables inspection of manholes where stable depth measurement with the automatic depth laser is not possible, i.e. shafts partially filled with water or aerosol/mist.

It is also possible to examine structures deeper than 10 meters - this means that it is possible to go deeper into the manhole. Of course, the maximum depth of investigation remains limited by the cable length.

### Features

- Enables inspection of shafts with difficult conditions, e.g. partially filled with water or aerosol/mist.
- For manual depth adjustment, so that it is possible to drive deeper into the manhole.
- The safety distance is still maintained but it is possible to drive up to the bottom with the camera head.
