

## Egg shaped packers

<https://ehle-hd.com/en/product/egg-shaped-packers/>

The **egg shaped rehabilitation packers** are used for the partial renovation of Ei-Profile pipes. The passage ensures maximum sewage flow. The short construction of approx. 1 m facilitates handling with the loaded packer.

The rehabilitation packer consists of a two-layer rubber body and a metal core. With a pressing length of approx. 600 mm the egg shaped packers are used for the repair of joints or short damaged areas. The end couplings are equipped with a roller chassis that ensures stable movement of the packer in the pipeline. The packers are supplied with passages so that the waste water can drain away during the rehabilitation.

### Features

- two-layer rubber body and a metal core
- compressed air connection: Quick coupling
- galvanized towing eye
- with wheel system for the exact positioning of the short liner (the rollers are at an angle of 120°)
- large passageway
- short design
- ISO 9001 TÜV certified

## Attributes
