

hand nozzles

<https://ehle-hd.com/en/product/hand-nozzles/>

The **hand nozzles of stainless steel** with pre-jet are suitable for cleaning shafts, containers or surfaces. They are usually connected directly to the end of the HP hose or to the HP gun barrel.

The pre-jet nozzles have interchangeable nozzles that allow the operator to work with different nozzle inserts (round and flat jet) and different pressures. This guarantees the safety of working at low pressures - this makes it easy to hold by hand.

Possible nozzle inserts are: M10 inserts made of ceramic/stainless steel with round jet or flat jet inserts.

Features

- manhole, pit and tank cleaning with HP gun
- surface cleaning in industry, trade, and civil engineering
- offshore and filter area cleaning

The hand nozzles are supplied with round jet ceramic/stainless steel nozzle inserts. Other nozzle inserts (e.g. flat jet) on request.
